

Welcome, White Glove Team

Your ProviderSoft → HHA automation guide
Prepared by **Advanced Automations**

Thank you for trusting us with this project. This guide explains—in plain language—what the software does each night, how it keeps your data in sync, and what your coordinators need to enter correctly in ProviderSoft so everything runs smoothly.

What this software does

Every night, the system quietly downloads selected reports from ProviderSoft, reads the rows, and updates HHA Exchange to match—without anyone logging in manually.

- **New cases & new services** — creates or updates the child, contract, and authorization in HHA.
- **Case closure** — when an entire case is finished, all active services in HHA are discharged.
- **Service discharge** — when only one service ends, only that service line is closed in HHA.
- **Verified sessions (API Report)** — matches therapist visits, links mobile clock-ins where required, and approves visits.

If something cannot be processed safely, you receive an email alert the same night—nothing is silently skipped except Early Intervention cases (by design).

How it works (simple overview)

- **Step 1 — Download:** The bot opens ProviderSoft and exports today's reports (like exporting a spreadsheet).
- **Step 2 — Read & organize:** Each row is checked for required fields and business rules.
- **Step 3 — Update HHA:** Patient, service, discharge, or session actions run in HHA Exchange.
- **Step 4 — Email summary:** You get a summary of successes, skips, and anything that needs attention.

When does it run? By default the nightly schedule is off until you approve go-live. When enabled: case reports run every night around 2:00 AM Eastern; session reports run Tuesday nights after

Monday's preview check.

What must be in each report

These fields are required for automation to work. If a column is missing or blank, that row will fail and appear in your alert email.

Gluck open (new intakes)

Filter: **Date of Intake = today**

- **Program Id** — unique case number
- **Child's Name**
- **Program Type** — must match a known HHA contract/payer
- **Service Type** — must match a known HHA billing code
- **Service Begin Date**
- **Authorization Number**
- **Date of Intake** — must be filled in ProviderSoft so the case appears in tonight's export
- Demographics for new patients: **Date of Birth, Address, City, State, Zip** (for HHA patient create)

New service (existing child, new service line)

Filter: **Date of Intake = today** (entered today, even if service starts later)

- **Program Id**
- **Program Type**
- **Service Type**
- **Service Begin Date** — actual start of the service in HHA
- **Authorization Number**
- Same HHA flow as Gluck open; child already exists in ProviderSoft/HHA

Discharge service (one service ends)

Filter: **Service Discharge Date = today**

- **Program Id**
- **Service Type** — **required**; must match the active line in HHA
- **Service Begin Date** — **required**; must match exactly
- **Program Type** — helps identify the correct line when a child has multiple services
- Use this report when the **case stays open** but one service ends

Gluck closure (whole case closed)

Filter: **Closure Date = today**

- **Program Id**
- **Closure Date**
- **Program Type**
- Discharges **all** active services for that child in HHA
- Use only when the entire case is finished—not for single-service discharge

API Report (verified sessions)

Filter: **Session date = last 7 days through today**

- **Session Id**
- **Program Id** / patient reference
- **Program Type**
- **Service Type**
- **Session Date**
- **Provider Name** — must match caregiver codes report
- **Pay Rate** — combined with Service Type for HHA pay code (e.g. OT + 72 → OT72)
- **Begin Time / End Time** — for EVV clock verification

Caregiver codes (reference list)

No date filter — full list export

- **Provider Name**
- **Caregiver Code** — HHA caregiver ID
- Downloaded with session runs so Provider Name can be matched

Coordinator checklist — please remember

- Fill **Date of Intake** on new cases the same day you enter them—otherwise tonight's Gluck open export will miss the row.
- For **discharge service**, always fill **Service Type + Service Begin Date**. Never leave them blank when a child has more than one active service.
- Use **gluck closure** only when the whole case is done. Use **discharge service** when one service ends and others continue.
- **Early Intervention** cases are never sent to HHA—this is intentional.
- If you add a new **Program Type** or **Service Type**, tell us before go-live so we can map it in HHA.
- Read alert emails the morning after a run—each item includes what to fix in ProviderSoft.

What happens when something goes wrong?

- You receive an email listing each problem row and plain-English guidance.
- The system prefers to **stop and alert** rather than update the wrong patient or wrong service.
- After you fix the data in ProviderSoft, the next nightly run will pick it up.
- Monday preview (dry-run) flags mapping gaps before Tuesday session processing.

We're here for you

Automation should make your evenings quieter—not add worry. If a report looks wrong, an alert is confusing, or you're unsure which report to use, reach out anytime.
