

ProviderSoft → HHA Automation Guide

Prepared by Advanced Automations

A plain-language guide for coordinators and managers — what runs automatically, when, and what you need to enter correctly in ProviderSoft.

Welcome

This software connects ProviderSoft to HHA Exchange so your team does not have to re-enter cases, services, discharges, and therapist visits by hand.

In one sentence: Every night the system downloads your ProviderSoft reports, reads each row, updates HHA to match, and emails you if anything needs attention.

- **New intakes & new services** → create/update patient, contract, and authorization in HHA
- **Case closure** → discharge all active services when the whole case is done
- **Service discharge** → close only one service line when others stay active
- **Verified sessions (API Report)** → match visits, link mobile clocks (EVV), approve sessions

How one automated run works

Each run follows the same four steps. Think of it like a careful assistant who exports your reports, checks every line, updates HHA, and sends you a summary.

Step 1 — Download reports from ProviderSoft

The bot logs into ProviderSoft (like a person would), opens each saved report, sets the date filter, and exports a spreadsheet. For case reports the filter uses **today's date** (Eastern time) because the run happens around **11:00 PM** — the same day coordinators enter Date of Intake, before midnight.

Step 2 — Read & validate each row

The system reads every row and checks required fields (Program Id, Service Type, Date of Intake, etc.). Early Intervention cases are skipped by design. Missing or unknown codes trigger an alert — the system will not guess.

Step 3 — Update HHA Exchange

For each valid row, the system finds the patient in HHA, creates or updates contracts, authorizations, discharges, or session visits. New Program Types and Service Types are looked up in HHA the first time they appear, then saved so future runs are faster.

Step 4 — Email summary

You receive an email listing successes, skips, and any rows that failed — with plain-English guidance on what to fix in ProviderSoft.

Date of Intake rule: Enter the case today → set Date of Intake = **today** → that same night's 11 PM run picks it up (filter = today).

Weekly schedule (when enabled)

After go-live approval, these are the planned run times (all ~11:00 PM Eastern). Schedules are currently off during setup — runs are manual until you enable them.

When	Reports	Writes to HHA?	Purpose
Every night	Gluck open, new service, gluck closure, discharge service	Yes — live	Sync cases & services entered today
Monday night	All case reports + caregiver codes (+ API Report if sessions enabled)	No — preview only	Monday Preview — see next page
Tuesday night	API Report + caregiver codes	Yes — live	Process verified sessions after Monday fixes

Monday Preview — what it is and why it matters

Monday Preview is a dry-run. It downloads and checks your reports but **does not write anything to HHA**. It is your early-warning system before Tuesday's live session processing.

What Monday Preview does

- Downloads the same reports as a normal run (cases, new services, caregiver list, and optionally API Report)
- Reads every row and checks whether Program Type, Service Type, pay codes, and caregiver names can be resolved
- Queries HHA **only when a code is not already known** — first miss looks up HHA and saves the mapping for later
- Sends an **email alert** listing anything that would fail on a live run
- **Never creates patients, contracts, discharges, or approved visits** in HHA

What you should do Tuesday morning

- Open the Monday Preview email (if you received one)
- Fix any flagged items in ProviderSoft — usually a misspelled Service Type, missing Provider Name, or new code not yet in HHA
- Ensure new HHA billing codes use the **exact same name** in ProviderSoft
- Tuesday night's live session run will then process the API Report successfully

What Monday Preview checks

Check	What it means if it fails
Program Type → HHA contract	Payer/program name in ProviderSoft does not match any HHA contract — fix spelling or add contract in HHA
Service Type → HHA billing code	Service name does not match HHA — fix spelling or create billing code in HHA admin
Provider Name → caregiver	Therapist name not found — update caregiver codes report or fix name spelling
Pay Rate + Service Type → pay code	Combination like OT72 not found in HHA — verify pay code exists
Required fields blank	Missing Date of Birth, Authorization Number, etc. on open reports

Important: If Monday Preview shows no issues, Tuesday's session run should proceed smoothly. If you skip reviewing Monday's email, Tuesday may fail on the same rows.

Reports — required fields & date filters

Each saved report in ProviderSoft must include the columns below. Blank required fields = row fails + email alert.

Report	Date filter (nightly)	Key required fields
Gluck open	Date of Intake = today	Program Id, Child Name, Program Type, Service Type, Service Begin Date, Authorization #, Date of Intake, DOB/Address
New service	Date of Intake = today	Program Id, Program Type, Service Type, Service Begin Date, Authorization #
Discharge service	Service Discharge Date = today	Program Id, Service Type , Service Begin Date (both required)
Gluck closure	Closure Date = today	Program Id, Closure Date, Program Type (discharges ALL services)
API Report	Session date: last 7 days	Session Id, Program Id, Service Type, Session Date, Provider Name, Pay Rate, Begin/End Time
Caregiver codes	No date filter	Provider Name, Caregiver Code (reference list for sessions)

Which report when?

Situation	Use this report
Brand-new child intake	Gluck open
Existing child, new service line	New service
One service ends, case stays open	Discharge service
Entire case finished	Gluck closure
Therapist visits to verify/approve	API Report (Tuesday live)

Coordinator responsibilities

- Fill **Date of Intake** the same calendar day you enter a case or new service
- Keep **Program Type** and **Service Type** spelled exactly like HHA admin names
- On discharge service rows, always fill **Service Type + Service Begin Date**
- Use **gluck closure** only when the whole case is done; use **discharge service** for one line ending
- Review **Monday Preview email** before Tuesday session processing
- Read alert emails the morning after any run and fix flagged rows in ProviderSoft

Risks to avoid

Risk	Prevention
Case not synced	Fill Date of Intake same day you enter the case
Wrong service discharged	Always fill Service Type + Begin Date on discharge service rows
New code fails	Match HHA name exactly in ProviderSoft; Monday Preview catches it early
Session not approved	Provider Name must match; caregiver must clock in on HHA mobile app (EVV)
Duplicate patient names in HHA	Ensure Program Id is linked in HHA — system will alert, not guess

We're here for you

Automation should make your evenings quieter — not add worry. If a report looks wrong, an alert is confusing, or you're unsure which report to use, reach out anytime. We built this for White Glove with care.
